Objectives:
This course is intended to introduce the students to the design and operation of manufacturing and service facilities. A conceptual description and classification of modern production environments will be presented and major issues during the planning and control of their operation will be addressed. We will focus on the decomposition of the overall production planning and control problem to a number of subproblems and the development of quantitative techniques and analytical tools for addressing the arising subproblems. The topics include (but are not limited to) assembly and transfer lines, sequencing and scheduling, flexible manufacturing systems, group technology and cellular manufacturing, and facilities planning and design.

Although the focus is on manufacturing systems, emphasis will be given to introduce the application of methodologies covered for manufacturing systems to service systems as well. The students are expected to have a solid background operations research.

Grading Policy:

\[ \text{AvgGrade} = 30\% \text{ Pop-up Quizzes} + 70\% \text{ Announced Quizzes} \]

In order to receive a passing letter grade you are required to achieve an AvgGrade of “40”. Otherwise, your letter grade will be “F”.

You are expected to work on the quizzes individually. You may be randomly requested to take an oral exam online following the quiz.

No make-up will be offered for any particular quiz. Two make-up quizzes (comprehensive, i.e. including all the topics) will be offered at the end of the semester to those who have missed any quiz. So, you are allowed to miss at most two (2) quizzes. If you miss more than two, the grades for the remaining quizzes will be “0” regardless of your excuse.
