Weeks Commencing/Topics:

Oct 5, 12 Part I

Thermodynamic systems

Piston-gas as a system

Idealizations and assumptions about the piston, the gas, and the environment

Gases

Ideal/perfect – what are the assumptions?

Laws – observations/experiments

Maxwell's "kinetic" theory

Molecular interactions – radial distribution function*

States – a generalization: $f(p, V, T, N) = 0$ – how do we know that these variables suffice to describe a state?

Work done

Oct 19, 26 Part II

Internal energy

Isolated systems – microcanonical formalism

Heat

Interactions with the environment – Isothermal, adiabatic, and all else

Canonical formalism – is there a pure mechanical correspondence? Ergodicity*

The first law

Gases

Expansions – what variables are fixed? Reversibility for each step or whole process?

The maximum work theorem

Expansion for different gases* Different piston constructs/shapes*

Nov 2, 9 Part III

The second law

I have not used "entropy." Why not talk about entropy first?

Cycles

Carnot – why Carnot? Are there other cycles? A general form of cycles*

Microscopic/nanoscale machines – what makes them different? Are they really different?

Finally, entropy

Szilard machine*

Can we relate the thermodynamic entropy to information (Shannon) and Kolmogorov entropy?

Maxwell's demon.

Nov 16 Recapitulation and the **Midterm**

Nov 23, 30 Part IV

Thermodynamic potentials

Which variables do you want to keep constant?

Are there any variables that are not "readily" measurable?

Helmholtz and Gibbs free energy

Legendre transformations – that may give a helping hand for other potentials in your research

The Maxwell relations

Extremum principles – Maupertius did it first! (A simple calculus of variations problem*)

The Nernst postulate and the Third Law

Dec 7, 14 Part V

Stability of Thermodynamic Systems

Explain, why

Addition of heat to a stable system must increase its temperature – volume Watson, how about volume?

Isothermal expansion of a stable system must decrease its pressure

Revisit the original "intuitive" arguments about the cycles

Revisit the first and the second laws

Le Châtelier's principle and Braun's amendment

Dec 21, 28 Part VI

Phase diagrams

Stabilities of phases

Phase boundaries and typical phase diagrams

Phase transitions

First-order phase transitions in single component systems

The discontinuity (of the volume – the lever rule; in the entropy – latent heat)

Phase loci – The Clapeyron equation

First order transitions in multicomponent simple systems – Gibbs' phase rule

Phase diagrams for binary systems

Tisza's and Ehrenfest's theories of second-order phase transitions

Jan 4

Fluctuations and Critical phenomena*

Work and heat fluctuations – (Jarzynsky and Crooks theorems)

Order parameters and critical exponents. Scaling and universality.

(*) Topics, a thorough coverage of which, go beyond the scope of the course.

Class Policies

Course will be online.

Hours to be synchronized: 1.5 hours/week (75 min/week) for whole class (all recorded)

1 hour*2/week (50min*2/week) for 2 times*20 (for each group, both recorded)

Hours to be asynchronous: 0.5 hours/week (25 min/week) for whole class (notes/viewgraphs/videos will be available)

Grading

Break-out room quizzes: (5-best/6) of them, one for each "mid-part;" total is for 15% of the final grade

Synchronous quizzes: (5-best/6) of them, one for each "part;" total is for 20% of the final grade

Midterm: 30% of the final grade

Final exam: 35% of the final grade; covers all the material
